

## How to update your price list in Expert Estimator

First of all, be sure you have the latest "build" version available. You can verify which version is currently installed in your computer by going to the Help Menu and then to "About Expert Estimator." You will see "Version 3.0.0 build XX"; the two X's correspond to your version of "build."

**You absolutely must have at least version 45 or the most recent version available. If your version is older than 45, take note of the number and move on to this step: My build is older than 45.**

### My build is older than 45

In this case, you absolutely must proceed to upgrading the "build" of your Expert Estimator software before moving on to update your price list.

1. Go on section Software Update of Expert Estimator web site.
2. Choose the corresponding number of your current version of Expert Estimator (the number that you were just asked to note down in a previous step).
3. The registration "BUILD XX Download" will appear further down. Click on Download and then Run Program. **At this point in time, it is essential that your Expert Estimator software is closed.**
4. The patch program will look for files to update. The "Apply patch" button in the lower right-hand corner of the screen will now become available. Click on it and you will have the latest version of "build." You can also continue to the step Upgrade to a new version of build past 45.

### Update price list from a build newer than 45

1. Open Expert Estimator.
2. Click on the last button in the 2nd row labelled "Price Update."
3. In the new window, select a division to update.
4. You must enter the EEWIN client number. To obtain this number, call a service agent from our technical support team or go to the website of your provider (Nedco, Westburne ou Wolseley).
5. When downloading, make sure you are connected to the Internet and that no firewalls are blocking Expert Estimator. Click on OK.
6. At this point, it is possible that the software will give you the impression that it is frozen, but that is not the case. If you do not receive an error message, then everything is working properly.
7. Wait for the window "Update successfully completed" to appear. **ATTENTION: If you do not see this window, then the update is not yet complete. Let the process continue until it is done.**
